

	GILES CHEMICAL ~ PREMIER MAGNESIA		
	Validation Protocol		
	Title: Swab Test Validation Protocol	Number: E13-VAL-RCV-761	
	Owner: Bryan Elchert	Revision: 0	
	Effective Date: July 25, 2013	Page: 1 of 11	

Approvals

Signing below indicates agreement that the protocol is ready for execution of the Swab Test Validation for Giles Repackaging located at 396 Smathers Street, Waynesville, NC.

Project Team Member	Functional Area	Signature	Date
Bryan Elchert	QA Laboratory		7/26/13
Patrick Owen	Engineering		7/26/13
Monte Plott	Production		7/26/13
Matt Haynes	Operations		7/26/13
Deborah Durbin	Quality		7/26/13

A final summary report that consists of results and conclusions based on the data collected after protocol execution will be written and approved. The executed protocol will be attached behind the report.

Controlled Document

Only those quality documents viewed through the Giles Chemical electronic Documentation System are officially controlled. All other copies, whether viewed through another computer program or a printed version, are not controlled and, therefore, the Quality Unit at Giles assumes no responsibility for accuracy of the document.

I. PURPOSE:

The purpose of this protocol is to certify with documented evidence that the Swab Test procedure for Swabbing After Scented Salt (Repackaging Swab Test Procedure, R12-PR-100-015), when followed properly, confirms that all fragrance oil has been removed or decreased to an acceptable level. In this procedure, Thin Layer Chromatography (TLC) is used to confirm that all fragrance oil is removed after cleaning. The TLC results will be confirmed using Total Organic Carbon (TOC) analysis and the procedure thereby validated.

II. BACKGROUND:

Scented Epsom Salt products are produced at the Repackaging Facility. The scent is injected into the pouches at the point of filling with a special funnel and nozzle. Until the salt reaches that point, it is suitable for human consumption. A product changeover is performed any time one of these lines is changed from scented product to a different scented product or scented product to product suitable for human consumption. Dawn Dishwashing Liquid is used for cleaning followed by an Isopropyl Alcohol mist. After cleaning, the lines are swabbed and Thin Layer Chromatography (TLC) is performed to confirm the removal of fragrance oil. Total Organic Carbon (TOC) analysis is then used to confirm and validate the results of the TLC analysis.

III. SCOPE

This validation covers the Swabbing After Scented Salt Testing Procedure. The result of the Swab Test, which utilizes Thin Layer Chromatography (TLC), is further validated using Total Organic Carbon (TOC) analysis.

IV. ROLES AND RESPONSIBILITIES

1. QA Laboratory

- ❖ Write and issue the protocol.
- ❖ Investigate protocol deviation reports.
- ❖ Test the rinse sample provided.
- ❖ Review raw data and originate interim notification to Quality Assurance.
- ❖ Write and route the final report.

2. Quality Assurance

- ❖ Review and approve the protocol.
- ❖ Review and approve raw data and notifications.
- ❖ Source and provide clean sample bottles.
- ❖ Execute the Cleaning Procedure correctly.
- ❖ Gather and properly label rinse samples.
- ❖ Review, approve, and store the final report.

3. Production & Quality Assurance

Controlled Document

	Validation Protocol		
	Title: Swab Test Validation Protocol	Number: E13-VAL-RCV-761	
	Owner: Bryan Elchert	Revision: 0	
	Effective Date: July 25, 2013	Page: 4 of 11	

- ❖ Review and approve the protocol.
- ❖ Review and approve the final report.

V. TEST PROGRAM

A. AT REPACKAGING

Objective: After the stainless steel funnel attachment was cleaned and swabbed, the samples were ready for analysis. In this case, 16 samples were analyzed by TLC to verify the removal of fragrance oil. The TLC results are then confirmed by TOC analysis.

Equipment/Materials

Repackaging Swab Test Cleaning Procedure (and associated materials) R12-PR-100-015

Swabs

Isopropyl Alcohol

TLC Silica Plate

Development Chamber

Black Light

Procedure

1. Using a pencil, a line is drawn about 1 inch from the bottom of the TLC Plate. A sample number is written below the line. The sample is then 'spotted' on the line above the corresponding sample number.
2. A sample of fragrance oil is spotted on the line to be used as a control.
3. After the fragrance oil (control sample), and the samples were 'spotted' on the TLC plate, the plate is put into the development chamber containing Isopropyl Alcohol and covered. The Isopropyl Alcohol is then allowed to migrate up the TLC plate.
4. After the Isopropyl Alcohol has migrated up the plate for a distance of about 4 inches, remove the TLC plate from the development chamber and allow it to dry.
5. When the TLC plate is dry, the lights are shut off and the black light is turned on. While holding the black light over the TLC plate, look for spots on the plate that fluoresce. About 2 inches above the place where the fragrance oil was 'spotted' will be a spot that fluoresces. This is the fragrance oil that migrated with the Isopropyl Alcohol up the TLC Plate.
6. Examine the TLC plate where the samples were 'spotted' for evidence of fluorescence. If there is no evidence of fluorescence in these areas, then no fragrance oil is present in the sample.
7. If there is evidence of fragrance oil in a sample, repeat this procedure using the suspect sample and fragrance oil as a control.

	Effective Date: July 25, 2013	Page: 5 of 11	

B. AT QUALITY ASSURANCE LAB

1. Prepare a 10 ppm Standard of Known Concentration.
2. Analyze TLC samples in triplicate on the Hach DR5000 Spectrophotometer using Hach Method 10129 for Low Range (0.3-20ppm) Total Organic Carbon (TOC).
3. Compare the TOC results to the TLC results. The results of both tests should confirm that there is no fragrance oil present.
4. Report the results.

VI. ACCEPTANCE CRITERIA

The Swab Test TLC results will be considered validated if the following criteria are all met:

1. The test result for the TOC Blank Sample is 0 ppm.
2. The test result for the individual TLC Samples is 1.0 ppm TOC or less.
3. The test result for the 10 ppm TOC Standard of Known Concentration has a value of 9.1-10.9 ppm for a 95% Confidence Limits of Distribution.

VII. CALIBRATION

Verify that all instrumentation that requires calibration is calibrated.

General Information

System Name: _____ Protocol Number: _____
 Deviation Report Number: _____ Protocol Step & Page No.: _____

Instructions

Instructions The validation specialist assigns a sequential report number for each deviation with a specific protocol.
 For example, 001, 002, etc. can be easily referenced in a report.

1. Reference the relevant protocol number, step and page number of the noted deviation above.
2. Complete the below listed sections. If necessary, use additional pages and attach any supporting info.
3. Include the original PDR(s) with the protocol as an attachment. Summarize the impact of the deviation in the Validation Report.
